

## Ethical Challenges in the 21<sup>st</sup> Century

Torben Riise, PhD

### Part III: Bioethics & The Frontier of Neuro-science

By: Torben Riise, PhD

We like to think that we are in control of our actions, but new results in neuro-science indicate that that may be wishful thinking.

What does that mean for, say, criminal behavior and society's response to crime – and for our perception of being guilty?

If we, by using biological intervention, can prevent or suppress criminal behavior, should we? Who should make that decisions? If it can be used in crime, why not in other areas? This lecture explores the frontier where science meets ethics.

Be prepared to be challenged!
